TEST BANK UNDERSTANDING PATHOPHYSIOLOGY 7TH EDITION BY SUE HUENTHER

Seventh Edition

UNDERSTANDING PATHOPHYSIOLOGY

Sue E. Huether Kathryn L. McCance Valentina L. Brashers

PART ONE: BASIC CONCEPTS OF PATHOPHYSIOLOGY
Unit 1: The Cell
Chapter 1. Cellular Biology
Chapter 2. Genes and Genetic Diseases
Chapter 3. Epigenetics and Disease
Chapter 4. Altered Cellular and Tissue Biology
Chapter 5. Fluids and Electrolytes, Acids and Bases Unit 2: Mechanisms of Self-Defense
Chapter 6. Innate Immunity: Inflammation and Wound Healing
Chapter 7. Adaptive Immunity
Chapter 8. Alterations in Immunity NEW
Chapter 9. Infection and Defects in Mechanisms of Defense
Chapter 10. Stress and Disease
Unit 3: Cellular Proliferation: Cancer
Chapter 11. Biology of Cancer
Chapter 12. Cancer Epidemiology Chapter 13. Cancer in Children and Adolescents
PART TWO: BODY SYSTEMS AND DISEASES
Unit 4: The Neurologic System
Chapter 14. Structure and Function of the Neurologic System
Chapter 15. Pain, Temperature, Sleep, and Sensory Function
Chapter 16. Alterations in Cognitive Systems, Cerebral Hemodynamics, and Motor Function
Chapter 17. Disorders of the Central and Peripheral Nervous Systems and Neuromuscular
Junction
Chapter 18. Alterations of Neurologic Function in Children
Unit 5: The Endocrine System
Chapter 19. Mechanisms of Hormonal Regulation
Chapter 20. Alterations of Hormonal Regulation
Chapter 21. Obesity and Disorders of Nutrition NEW
Unit 6: The Hematologic System
Chapter 22. Structure and Function of the Hematologic System
Chapter 23. Alterations of Hematologic Function
Chapter 24. Alterations of Hematologic Function in Children
Unit 7: The Cardiovascular and Lymphatic Systems
Chapter 25. Structure and Function of the Cardiovascular and Lymphatic Systems
Chapter 26. Alterations of Cardiovascular Function
Chapter 27. Alterations of Cardiovascular Function in Children
Unit 8: The Pulmonary System
Chapter 28. Structure and Function of the Pulmonary System
Chapter 29. Alterations of Pulmonary Function
Chapter 30. Alterations of Pulmonary Function in Children
Chapter Unit 9: The Renal and Urologic Systems
Chapter 31. Structure and Function of the Renal and Urologic Systems
Chapter 32. Alterations of Renal and Urinary Tract Function
Chapter 33. Alterations of Renal and Urinary Tract Function in Children
Unit 10: The Reproductive Systems
Chapter 34. Structure and Function of the Reproductive Systems
Chapter 35. Alterations of the Female Reproductive System

Chapter 36. Alterations of the Male Reproductive System
Unit 11: The Digestive System
Chapter 37. Structure and Function of the Digestive System
Chapter 38. Alterations of Digestive Function
Chapter 39. Alterations of Digestive Function in Children
Unit 12: The Musculoskeletal and Integumentary Systems
Chapter 40. Structure and Function of the Musculoskeletal System
Chapter 41. Alterations of Musculoskeletal Function
Chapter 42. Alterations of Musculoskeletal Function in Children
Chapter 43. Structure, Function, and Disorders of the Integument
Chapter 44. Alterations of the Integument in Children

Understanding Pathophysiology 7th Edition Test Bank

Chapter 1. Cellular Biology

Multiple Choice

1. A student is observing a cell under the microscope. It is observed to have supercoiled DNA with histones. Which of the following would also be observed by the student?

- a. A single circular chromosome
- b. A nucleus
- c. Free-floating nuclear material
- d. No organelles

ANS: B

The cell described is a eukaryotic cell, so it has histones and a supercoiled DNA within its nucleus; thus, the nucleus should be observed.

A single circular chromosome is characteristic of prokaryotic cells, which do not have histones.

Free-floating nuclear material describes a prokaryotic cell, which would not have a distinct nucleus.

Eukaryotic cells have membrane bounded cellular components called organelles. No organelles describes a prokaryotic cell.

2. A nurse is instructing the staff about cellular functions. Which cellular function is the nurse describing when an isolated cell absorbs oxygen and uses it to transform nutrients to energy?

- a. Metabolic absorption
- b. Communication
- c. Secretion
- d. Respiration

ANS: D

The ability of the cell to absorb oxygen refers to the cells function of respiration.

The ability of the cell to function within a society of cells refers to its function of communication.

The ability of the cell to take in nutrients refers to the cells function of metabolic absorption.

The ability of the cell to synthesize new substances and secrete these elsewhere refers to the cells function of secretion.

3. A eukaryotic cell is undergoing DNA replication. In which region of the cell would most of the genetic information be contained?

- a. Mitochondria
- b. Ribosome
- c. Nucleolus
- d. Nucleus

ANS: C

The region of the cell that contains genetic material, including a large amount of ribonucleic acid, most of the DNA, and DNA-binding proteins, is the nucleolus.

The mitochondria is the site of cellular respiration.

The ribosomes are involved in manufacturing of proteins within the cell.

The nucleus contains the nucleolus, and it is the nucleolus that contains genetic material.

4. The fluid mosaic model for biologic membranes describes membrane behavior. According to this model, which of the following float singly or as aggregates in the fluid lipid bilayer?

- a. Peripheral membrane proteins
- b. Integral membrane proteins

- c. Glycoproteins
- d. Cell adhesion molecules

ANS: B

Integral membrane proteins float freely in the fluid lipid bilayer.

Peripheral membrane proteins are not embedded in the layer, but reside at the surface.

Glycoproteins act as cell surface markers.

Cell adhesion molecules are on the outside of the membrane and allow cells to hook together.

- 5. Which of the following can bind to plasma membrane receptors?
- a. Oxygen
- b. Ribosomes
- c. Amphipathic lipids
- d. Ligands

ANS: D

Ligands are specific molecules that can bind with receptors on the cell membrane.

Oxygen moves by diffusion; it does not bind to receptors.

Ribosomes make proteins and are not involved in binding.

Amphipathic lipids are a portion of the cell membrane.

6. A nurse is reviewing a report from a patient with metastatic cancer. What finding would support the diagnosis of metastatic cancer? Alterations in extracellular matrix that include:

- a. Decreased fibronectin
- b. Increased collagen
- c. Decreased elastin

d. Increased glycoproteins

ANS: A

Reduced amounts of fibronectin are found in some types of cancerous cells, allowing cancer cells to travel, or metastasize.

Collagen provides strength, and its breakdown is associated with osteoarthritis, not cancer.

Elastin is found in the lungs and allows tissues to stretch; it is not associated with cancerous cells.

Decreased, not increased, glycoproteins are associated with cancerous cells.

- 7. Which form of cell communication is used to relate to other cells in direct physical contact?
- a. Cell junction
- b. Gap junction
- c. Desmosomes
- d. Tight junctions

ANS: A

Cell junctions hold cells together and permit molecules to pass from cell to cell.

Gap junctions allow communication from the inside of one cell to the inside of another.

Desmosomes are not involved in communication, but allow cells to hold together.

Tight junctions are barriers that prevent movement of some substances and leakages of others.

8. Pancreatic beta cells secrete insulin, which inhibits secretion of glucagon from neighboring alpha cells. This action is an example of which of the following signaling types?

- a. Paracrine
- b. Autocrine
